WORKFORCE INTELLIGENCE TOOL

WIT

Real-Time Agent Status Monitoring & Compliance Automation

Document Type	Problem Statement & Prototype Approach
Prepared By	UFAC Live Agent (Operations) & UFAC GTM Analyst
Organization	Teleperformance — Meta Partnership
Division	UFAC Live Contingent Workforce
Domain	Workforce Management / Agentic AI / Data Engineering
Version	v1.0 — Initial Pitch Draft
Date	21 April 2026
Classification	Confidential — Internal Use Only

1. Executive Summary

Teleperformance's UFAC Live operation — delivering contingent live support for Meta — currently operates across two disconnected workforce management platforms: Meta's AgentConnect (used for agent-side case status management) and Teleperformance's IEX (used for scheduling, breaks, login/logout, and payroll compliance).

This disconnect creates measurable, recurring losses: break non-compliance, untracked After Contact Work (ACW) billed to Teleperformance rather than Meta, missed SLAs, unequal workload distribution, and a lack of real-time visibility for Team Leaders and Operations management.

This document presents a formal problem statement and a phased prototype approach to build the Workforce Intelligence Tool (WIT) — a lightweight scraper and analytics layer that bridges AgentConnect and IEX data. WIT will surface real-time agent status dashboards, automated compliance alerts, and workload equity analytics — without requiring direct access to production systems in its initial phase.

Core Proposition

WIT does not replace AgentConnect or IEX. It reads, correlates, and acts on their data — filling the visibility gap that currently costs Teleperformance revenue, compliance standing, and agent morale.

Built by two insiders — one agent on the floor, one on the GTM analytics side — this tool is designed from lived operational experience, not assumptions.

2. Background & Operational Context

2.1 Platform Landscape

The UFAC Live operation spans two platforms with no native integration:

Platform	AgentConnect (Meta)	IEX (Teleperformance)
Owner	Meta Platforms	Teleperformance
Primary Use	Case assignment, agent status, ACW, live case workflow	Scheduling, breaks, lunch, login/logout, payroll
Pays For	Active case handling time (billable to Meta on hourly basis)	Full agent salary including gaps Meta does not cover
Integration	**NONE — no native data bridge to IEX**	**NONE — no native data bridge to AgentConnect**

2.2 The Visibility Gap

Because neither platform communicates with the other, Team Leaders and Operations staff must manually cross-reference agent statuses in two separate systems — a process that is slow, error-prone, and does not scale. The result is a systemic blind spot in workforce management that translates directly into financial and quality risk for Teleperformance.

3. Problem Statement

Teleperformance's UFAC Live operation lacks a unified, real-time view of agent compliance status across AgentConnect and IEX. This gap results in three distinct, quantifiable operational failures:

#	Problem	Description	Business Impact
P1	**Break Non-Compliance**	Agents frequently skip scheduled breaks and attempt to take them in the final hour of shift. IEX schedules are ignored in practice because there is no real-time enforcement or alerting mechanism.	Policy violations, regulatory risk, agent burnout, potential HR liability, and skewed adherence scores.
P2	**Untracked After Contact Work (ACW)**	When an agent completes a live case and begins filling internal notes, they enter ACW status in AgentConnect. Meta does not pay for ACW time. Teleperformance covers the shortfall against agent salaries.	Direct revenue leakage per agent per day. Across a team, this compounds into material monthly losses that erode contract margins.
P3	**SLA Risk & Unequal Workload Distribution**	High-performing agents resolve 30-35 cases vs. team average of 20-25. This gap is invisible to management. Excess ACW time by lower-performing agents reduces case availability, risking SLA breaches and quality drops.	SLA penalties, client relationship risk with Meta, morale degradation for top performers, hidden productivity losses.

3.1 Root Cause Analysis

The root cause is not agent behaviour — it is systemic invisibility. Without a unified data layer, no one can act on what no one can see. The problems above are symptoms of a single underlying gap:

Root Cause

There is no mechanism to cross-reference an agent's real-time status in AgentConnect with their scheduled obligations in IEX, and no automated system to alert agents, Team Leaders, or Operations when compliance thresholds are crossed.

4. Proposed Solution — Workforce Intelligence Tool (WIT)

4.1 Vision

WIT is a scraper-based data bridge and analytics layer that reads agent status data from AgentConnect and schedule data from IEX, correlates them in real time, and delivers actionable alerts and dashboards to agents, Team Leaders, and Operations — without modifying or replacing either source system.

4.2 Core Capabilities

Capability	What It Does
Real-Time Status Mapping	Polls or scrapes AgentConnect and IEX at configurable intervals. Maps each agent's current AgentConnect status (Available, ACW, Break, etc.) against their IEX-scheduled state for that time slot.
Compliance Alert Engine	Detects deviations: agent on break when not scheduled, agent in ACW beyond threshold, agent overdue for scheduled break, or agent in an unauthorised status. Sends tiered alerts to Agent, TL, and Ops.
ACW Time Tracker	Tracks ACW entry and exit timestamps per agent per case. Aggregates daily ACW totals per agent. Flags agents exceeding ACW benchmarks. Provides data for billing reconciliation with Meta.
Performance & Workload Dashboard	Visualises cases resolved per agent, ACW time, break adherence, and availability windows. Surfaces productivity outliers (high and low) to enable fair workload distribution.
SLA Risk Predictor	Uses current team availability, ACW volume, and queue depth to estimate SLA exposure in real time. Flags at-risk windows before they breach.
Agentic Alert Orchestration	An AI agent layer that autonomously monitors status streams, applies compliance rules, escalates unresolved violations, and generates shift-end compliance summaries.

5. Technical Architecture & Approach

5.1 Architecture Overview

WIT is designed as a cloud-native, event-driven pipeline with five layers:

Layer 1 — Data Acquisition (Scraper Engine)

Technology: Python (Playwright / Selenium for UI scraping; requests + BeautifulSoup for API-accessible endpoints)

Function: Authenticates with AgentConnect and IEX, polls agent status at configurable intervals (suggested: 60-second polling), and emits structured JSON events to a message queue.

Prototype approach: Runs against a mock/demo environment or sanitised test accounts — no direct production access required.

Layer 2 — Event Streaming & Ingestion

Technology: Apache Kafka (cloud-managed via Confluent Cloud) or AWS Kinesis for prototype simplicity

Function: Acts as the real-time backbone. Status events from both platforms are published to separate topics and consumed by downstream processors.

Why Kafka: Decouples the scraper from analytics, supports replay for debugging, and scales linearly when agent volume grows.

Layer 3 — Correlation & Rules Engine

Technology: Python microservice (FastAPI) with a configurable rules DSL; optionally LangChain for agentic rule expansion

Function: Receives agent status events, looks up current IEX schedule for that agent, applies compliance rules (break window, ACW threshold, unauthorised status), and emits alert events.

Agentic AI layer: An LLM-based agent (Claude via Anthropic API) monitors aggregated status, identifies patterns (e.g. repeated late-break behaviour), and generates natural-language shift summaries for TLs.

Layer 4 — Storage & Analytics

Technology: PostgreSQL (relational store for schedule and compliance records) + ClickHouse or AWS Redshift for time-series analytics

Function: Stores all agent status events, ACW durations, alert histories, and resolved/unresolved compliance flags. Powers dashboard queries.

Revenue loss calculation: ACW time per agent x hourly rate = daily unbilled exposure. Automated nightly report to Ops leadership.

Layer 5 — Alerting & Dashboard

Technology: Grafana (dashboards) + Slack / Microsoft Teams webhook integration (alerts) + optional React web app for a branded WIT UI

Function: Delivers tiered alerts (Agent notification, TL escalation, Ops visibility). Live dashboard shows all agents colour-coded by compliance status. Shift-end report auto-generated.
Alert tiers: Tier 1 (Agent warned), Tier 2 (TL notified after 5 min no response), Tier 3 (Ops escalated after 10 min).

5.2 Technology Stack Summary

Component	Technology	Rationale
Scraper Engine	Python + Playwright	Handles modern JS-rendered UIs in AgentConnect and IEX
Message Queue	Kafka (Confluent Cloud) / AWS Kinesis	Real-time, decoupled, replay-capable event streaming
Rules Engine	FastAPI + Python rules DSL	Lightweight, configurable, easy to extend compliance rules
Agentic AI	Claude API (Anthropic) + LangChain	Natural language pattern analysis, shift summaries, anomaly narration
Cloud Platform	AWS (Lambda, RDS, S3) or GCP equivalent	Scalable, managed, low operational overhead for prototype
Analytics Store	PostgreSQL + ClickHouse	Structured compliance records + fast time-series queries
Dashboard	Grafana + React (WIT UI)	Real-time visualisation, agent colour maps, trend charts
Alerting	Slack / Teams webhooks + email	Zero-friction delivery to agents, TLs, and Ops channels
CI/CD	GitHub Actions + Docker	Containerised, reproducible, easy to hand off to Teleperformance IT

6. Prototype Roadmap

Given that direct access to production AgentConnect and IEX environments is not available at this stage, the prototype will be developed in four phases using synthetic data, mock environments, and eventually sandbox credentials requested through proper channels.

Phase	Name	Key Tasks	Deliverable
Phase 1 2–3 Wks	**Synthetic Data Prototype**	Build mock AgentConnect and IEX data generators. Create compliance rules engine. Build basic Grafana dashboard. Demonstrate end-to-end alert flow with fabricated data.	Working local demo — rules engine, alerts, dashboard
Phase 2 2–3 Wks	**Scraper Development**	Develop Playwright scrapers for AgentConnect and IEX UI flows. Test against personal/test accounts. Extract status, timestamps, schedule data. Build JSON normalisation layer.	Functional scraper modules with sanitised real-format data
Phase 3 2–3 Wks	**Integration & Agentic Layer**	Connect scrapers to Kafka pipeline. Integrate Claude AI agent for pattern analysis and shift summaries. Deploy on AWS (Lambda + RDS). Build Slack/Teams alert webhooks.	Cloud-deployed MVP with AI agent and real-time alerts
Phase 4 Ongoing	**Pilot & Handoff**	Request sandbox access from Teleperformance IT. Run parallel pilot with live data. Gather TL and Ops feedback. Harden for production. Prepare full handoff documentation.	Production-ready WIT delivered to Teleperformance IT

7. Business Case & ROI

7.1 Financial Impact of the Current State

The following illustrates the revenue leakage from ACW alone, based on conservative estimates:

Metric	Conservative Estimate	Impact
Avg. ACW per agent per day	20–40 minutes	Unbilled time absorbed by TP
ACW across a team of 20 agents	400–800 min / day	6.7–13.3 hours of unbilled labour daily
Monthly unbilled ACW exposure	~130–260 agent-hours/month	Direct salary cost with no Meta recovery
Break non-compliance incidents	Multiple per shift across team	HR risk + potential regulatory exposure
SLA breaches from low availability	1–2 per month estimated	Client satisfaction risk + potential penalties

7.2 What WIT Recovers

- ACW Visibility: Real-time ACW tracking allows Teleperformance to document unbilled time and renegotiate billing terms with Meta or build contractual ACW caps — directly recovering margin.
- Break Compliance: Automated alerts eliminate last-hour break stacking, reducing HR risk and improving agent wellbeing and retention.
- SLA Protection: Availability forecasting prevents the team from falling below SLA thresholds before they breach, not after.
- Performance Equity: Workload dashboards surface the gap between high and low performers, enabling coaching interventions and fair recognition of top agents.
- Operational Efficiency: TLs spend zero time manually monitoring statuses. Ops teams receive automated shift reports instead of compiling them manually.

7.3 Cost of Building WIT

Low-Cost, High-Return Proposition

Development Cost: Two internal employees contributing voluntarily — no external contractor cost.

Infrastructure Cost (Prototype): AWS free tier + Confluent Cloud free tier + open-source tooling. Estimated cloud cost under EUR 50/month at prototype scale.

Time Investment: 8–12 weeks to working prototype; phased delivery means value is visible within weeks, not months.

Risk: Low — WIT is read-only in prototype. No production systems modified. Fully isolated from TP and Meta core infrastructure.

8. Data Access, Compliance & Ethics

WIT will be developed and operated in full compliance with Teleperformance's data governance policies and applicable data protection regulations. The following principles govern the approach:

1. **Prototype Data:** The prototype uses only synthetic or voluntarily provided test-account data. No production data is accessed without explicit authorisation from Teleperformance IT and Compliance.
2. **Agent Privacy:** All agent data processed by WIT is anonymised in dashboards and reports. Individual performance data is accessible only to that agent and their direct TL.
3. **Read-Only Principle:** WIT operates as a read-only observer of AgentConnect and IEX. It does not write to, modify, or interfere with either platform.
4. **Access Request Process:** Formal sandbox access will be requested through the appropriate Teleperformance IT channels before any live data integration proceeds.
5. **Code Ownership:** All code will be maintained in a private GitHub repository with access controls. Full documentation and handoff materials will be provided to Teleperformance IT.

9. The Team

Operations Insight (Ujwal Mojidra – Live Agent UFAC)	GTM Analytics (Lakshay Kapur – GTM Analyst UFAC)
Role: UFAC Live Contingent Agent (Meta) Expertise: Data Science, Agentic AI, Cloud Unique Value: Direct floor experience — observes status problems in real time. Knows exactly what a 30-case agent looks like vs. a 20-case agent and where the gaps emerge.	Role: UFAC GTM Analyst (Meta) Expertise: Data Science, Dev, Cloud, GTM Strategy Unique Value: Cross-functional GTM perspective — understands how workforce data connects to commercial outcomes for both Teleperformance and Meta.

Why This Team?

This is not a pitch from external consultants who have studied the problem from the outside. Both contributors work inside the operation daily. The problems described in this document are not inferences — they are observed, lived realities. WIT is built on that inside knowledge, which no external tool vendor can replicate.

10. What We Are Asking For

We are not asking for budget, headcount, or production system access at this stage. Our request is simple:

6. **Hearing:** A 30-minute presentation slot with Teleperformance Ops leadership and/or IT to demonstrate the prototype and present the business case.
7. **Greenlight:** Endorsement to proceed with prototype development using synthetic data (no approvals required for this phase).
8. **IT Introduction:** Introduction to the appropriate Teleperformance IT contact for future sandbox access request when the prototype is ready.
9. **Compliance Guidance:** Feedback on the compliance and data governance requirements we need to satisfy for full production deployment.

Our Commitment

We are undertaking this voluntarily because we believe it is the right thing for the business, for our colleagues, and for the partnership with Meta.
We will deliver a working prototype on our own time. We will document everything. We will hand it over cleanly.
We are not asking to be paid extra for this — we are asking to be heard.

11. Conclusion

The gap between AgentConnect and IEX is not a technology problem — it is a visibility problem. And visibility problems are exactly what data engineering and agentic AI are designed to solve.

WIT is a targeted, low-risk, high-return intervention that addresses three concrete operational failures simultaneously: break non-compliance, ACW revenue leakage, and SLA risk from unequal workload distribution. It is built by insiders, for the operation they work in — which means it will be designed correctly from day one.

Teleperformance's mission is operational excellence. WIT is one step toward that — and we are ready to build it.
